Hi everyone:

I'm currently working with Mark Orr at Virginia Tech and we're using LENS for individual agents in an agent-based model. I'm trying to package up LENS 2.63 so it's easier to install for everyone.

I've already created a docker image [1] for the program, and I'm in the middle of submitting a pre-built package to conda-forge [2].

However, for me to submit the package to conda-forge, I need to specify the license of the program.

Is there a particular Licence I can list in the metadata?

ideally, it's one that is listed here: <https://choosealicense.com/licenses/>

- Dan

I applaud your effort! I can't really figure out which license would be more appropriate – I believe as it is we were thinking of the GPL about 10 years ago when I had active involvement with Lens. The numerosity of similar licenses seems to have metastasized – which one would you prefer?

So I'm at SciPy right now, and I would've suggested MIT (since I'm not a lawyer).
But, the general consensus here is to use BSD 3-Clause: <https://opensource.org/licenses/BSD-3-Clause>

I'm just not sure what I would put in for the year and copyright holder.
Would it be Douglas Rohde?

The package I'm creating is also a version behind since that was the only thing I got working with the help of David Plaut

Doug Rohde should be the copyright holder, in my view, but let's see what Dave has to say!

I agree (not that I think he cares at this point).

Just to clarify I'll be using the GPLv3 License and Dough Rohde as the copyright holder.

Can I also use this email thread as a reference?

I'll send you guys a link when everything is up and running.
